Exp No: 2

Run a basic Word Count Map Reduce program to understand Map Reduce Paradigm Aim:

To Run a basic Word Count MapReduce program to understand Map Reduce Paradigm.

Procedure:

Step 1: Create Data File:

Create a file named "word_count_data.txt" and populate it with text data that you wish to analyze. Login with your Hadoop user.

```
File Machine View Input Devices Help

GNU nano 7.2

My name is Kavin.

I am from CSE Department of Rajalakshmi Engineering College
```

Step 2: Mapper Logic - mapper.py:

Create a file named "mapper.py" to implement the logic for the mapper. The mapper will read input data from STDIN, split lines into words, and output each word with its count.

```
nano mapper.py
```

Copy and paste the mapper.py code

#!/usr/bin/env python3

import sys because we need to read and write data to STDIN and STDOUT

```
#!/usr/bin/python3
import sys for line
in sys.stdin:
    line = line.strip()
        # remove leading and trailing whitespace
        words = line.split()
        # split the line into words for word in words:
        nano word count.txt print( '%s\t%s' % (word, 1))
```

Step 3: Reducer Logic - reducer.py:

Create a file named "reducer.py" to implement the logic for the reducer. The reducer will aggregate the occurrences of each word and generate the final output.

ROLL NUMBER: 210701114

```
nano reducer.py
# Copy and paste the reducer.py code
reducer.py #!/usr/bin/python3 from
operator import itemgetter import
sys current word = None
current_count = 0 word = None for
line in sys.stdin:
        line = line.strip()
 word, count = line.split('\t', 1)
        count = int(count)
                             except
try:
ValueError:
               continue
if current word == word:
               current count += count
                       if
       else:
current word:
                       print( '%s\t%s' % (current word, current count))
               current count = count
        current_word = word if
current word == word:
        print( '%s\t%s' % (current word, current count))
```

Step 4: Prepare Hadoop Environment:

Start the Hadoop daemons and create a directory in HDFS to store your data.

start-all.sh

hdfsdfs -mkdir /word_count_in_python hdfsdfs -copyFromLocal /path/to/word_count.txt/word_count_in_python

Step 5: Make Python Files Executable:

Give executable permissions to your mapper.py and reducer.py files. chmod

777 mapper.py reducer.py

Step 6: Run Word Count using Hadoop Streaming:

Download the latest hadoop-streaming jar file and place it in a location you can easily access.

Then run the Word Count program using Hadoop Streaming.

hadoop jar /path/to/hadoop-streaming-3.3.6.jar \

-input /word_count_in_python/word_count_data.txt \

ROLL NUMBER: 210701114

- -output /word count in python/new output \
- -mapper /path/to/mapper.py \
- -reducer /path/to/reducer.py

```
\oplus
                                                                                           Q
                                                                                                 \equiv
